

For a **cozy Windows Pomodoro app**, I'd keep the product intentionally small: the main experience should feel like a calm desktop companion rather than a productivity dashboard.

The **always-on-top timer overlay** could actually be your differentiating feature.

1. Main screens

1. Focus / Home

This should be the screen you spend most of your time in.

Features:

- Large timer
- Current session type
- Start / Pause / Skip
- Session progress
- Today's completed sessions
- Current task/focus label
- Quick access to settings
- Optional ambient animation/background

I'd make this **the default screen**.

2. Focus Session Setup

Before starting a session:

A dark-themed screenshot of a 'Focus Session Setup' interface. At the top, it asks 'What are you working on?' with a text input field containing 'Build authentication...'. Below this, it asks 'Focus duration' with a text input field containing '25 min'. Further down, there are three radio button options: 'Deep Focus', 'Normal', and 'Custom'. At the bottom, there is a button labeled '[Start Focus]'.

The task field is useful because your history can later say:

A light blue horizontal bar representing a history entry. It starts with a vertical blue line on the left, followed by the text '25 min — Build authentication API' in a bold, dark font.

25 min — Build authentication API

rather than just:

A light blue horizontal bar representing a history entry. It starts with a vertical blue line on the left, followed by the text '1 Pomodoro' in a dark font.

1 Pomodoro

3. Statistics

Keep this cozy rather than turning it into an enterprise analytics dashboard.

This Week

12h 35m
Focus Time

A horizontal bar chart with a dark blue background. The y-axis lists the days of the week: Mon, Tue, Wed, Thu, and Fri. The x-axis represents time in hours and minutes, with a total of 12h 35m indicated at the top. Each bar is composed of segments: a solid light blue segment followed by a dashed light blue segment. The lengths of the bars vary by day: Mon is approximately 3h 15m, Tue is approximately 4h 15m, Wed is approximately 2h 15m, Thu is approximately 5h 15m, and Fri is approximately 3h 15m.

Day	Focus Time (h:m)
Mon	3:15
Tue	4:15
Wed	2:15
Thu	5:15
Fri	3:15

27 Sessions

🔥 Current streak: 5 days

Useful metrics:

- Focus time
- Completed sessions
- Sessions/day
- Daily/weekly/monthly
- Streak
- Most productive time
- Tasks completed

Don't overload it with 20 charts.

4. Break / Rest screen

This is where you can really make the app feel cozy.

Instead of:

BREAK — 05:00

you could have:

Take a little break ☕

04:32

Stretch your legs.
Look away from the screen.

[Skip Break]

You could have subtle rotating messages:

- "Grab some water."
- "Look outside for a minute."
- "Relax your shoulders."
- "Your work will still be here."

5. History

A simple timeline:

Today

09:10	Focus	25 min
09:35	Break	5 min
09:40	Focus	25 min
10:05	Break	5 min
10:10	Focus	25 min

Yesterday

14:20	Focus	50 min
15:10	Focus	25 min

Could eventually allow filtering by task/project.

6. Settings

I'd divide this into a few sections instead of one giant settings page.

Timer

- Focus duration
- Short break
- Long break
- Sessions before long break
- Auto-start breaks
- Auto-start focus

Overlay

- Enable overlay
- Position
- Opacity
- Size
- Show remaining time
- Show progress
- Show task name
- Click-through mode
- Always on top

Appearance

- Theme
- Accent color
- Font
- Minimal mode
- Animation intensity

Notifications

- Sound

- Windows notification
 - Notification duration
 - Different sound for focus/break
-

★ The important feature: Floating Overlay

This is what I'd build the product around.

When you're coding in VS Code, for example:

The overlay should be **tiny and unobtrusive**.

Overlay modes

I'd actually provide **3 modes**.

1. Minimal

Probably the default.

2. Compact

● 18:42
Deep Work

3. Expanded

Deep Work
18:42

Pause Stop

Make the overlay behave like a desktop widget

This is important.

It should support:

Drag

Move it anywhere.

Resize

Small → medium → large.

Snap

Corners/edges of screen.

Opacity

For example:

Opacity

● 75%

Always on top

It remains above VS Code, Chrome, Figma, etc.

Click-through

This would be a really nice feature.

When enabled, the timer becomes visually present but doesn't intercept mouse clicks.

For example:

Then perhaps a keyboard shortcut temporarily disables click-through.

Global keyboard shortcuts

This would make the app much nicer for developers.

For example:

Shortcut	Action
Ctrl + Alt + P	Start/Pause
Ctrl + Alt + S	Skip
Ctrl + Alt + O	Show/Hide overlay

Ctrl + Alt + M

Toggle minimal overlay

The shortcuts should work **even when VS Code or another application has focus**.

Tray experience

You don't necessarily need the main window open.

The Windows system tray could have:

 CozyFocus

▶ Start Focus

 Pause

 Skip

18:42 remaining

Show Timer

Settings

Quit

This makes it feel like a proper Windows desktop utility.

Windows notifications

When the session finishes:

Focus session complete 

Nice work. Take a 5-minute break.

Then:

Break finished 🌱

Ready for another focus session?

You could also have a subtle sound.

Suggested navigation

I wouldn't make 10+ screens.

Something like:

And the **overlay isn't really a screen**—it's a persistent desktop layer controlled by the main app.

A cozy visual direction

Since you're aiming for cozy rather than generic productivity software, I'd avoid the typical:

blue + white + corporate dashboard

Think:

You could use:

- warm off-white background
- muted green / brown / terracotta accents
- soft rounded cards
- subtle shadows
- tiny animations
- gentle typography
- small illustrated elements
- optional dark mode

But keep the **timer itself extremely legible**.

One feature I'd seriously consider: Focus Mode

When the user starts a session:

Everything unnecessary disappears.

The overlay becomes the only persistent UI.

That gives you a nice product philosophy:

Start a timer → get out of the way → help me focus.

For your particular use case as a developer, I'd make **the floating overlay + global shortcuts + tray app** the core of v1, rather than spending the first version building elaborate statistics.
